

PIC GPIO: 14 destinations still missing

U4 / PIC16F18855 / 28-pin SOIC | Pin numbers are physical package numbers, not schematic drawing order.

Orange = unresolved GPIO to trace Grey = already represented, sometimes still inferred

Orientation: pin 1 is at the lower right, beside the round moulded dot (blue ring).
Right row: bottom to top 1-14. Left row: top to bottom 15-28. Do not mirror the image.

Unpowered checks: disconnect battery and programmer. Compare low readings with your shorted-probe baseline (about 0.5 ohm).

Reply example: U4.3 -> Rxx, left pad -> 0.7 ohm. A visual trace is useful too. Give exact pads and actual ohms, rather than only a beep.

Orange lines are callout leaders, not traced copper. Source: your new close-up; original photograph pixels retained.

Pinout: Microchip DS40001802G, page 4. Current schematic: v0.7. Date: 2026-10-08. Full details: evidence/pic_gpio_request.json.

Connection checklist

Fill one or more destinations for each orange pin.

Pin	GPIO	Destination / pad / reading
3	RA1	
5	RA3	
6	RA4	
7	RA5	
11	RC0	
12	RC1	
13	RC2	
15	RC4	
16	RC5	
17	RC6	
21	RB0	
22	RB1	
23	RB2	
25	RB4	

Already has a local connection, but the complete net may still need tracing:

2: C25 | 4: C39 | 14: TP11 | 18: TP17 | 24: R4 | 26: TP10/R35 | 27/28: ICSP nodes.

These are not included in the 14 orange pins. MCLR and crystal pins are already represented too.
