

PIC: connections recovered from existing photos

Callouts mark endpoints; the straight leaders are annotations, not fabricated copper tracks.

A - pin 24 / RB3 to R4 lower pad

Direct visible copper. R4 was incorrectly tied to ground; that tie is removed.

B - pin 18 / RC7 to TP17

Direct local trace. The lowest top-edge continuation to R13 is probable across overlapping photos; retained as a qualified inference.

C - C32 across pins 20 and 19

VDD and VSS respectively. C32 moved from the PIR block to the PIC supply. Its 100 nF value remains an estimate.

D - pin 2 / RA0 to C25 right pad

The old VDD connection and generic 100 nF value are withdrawn.

E - pin 4 / RA2 to C39 left pad

The old VDD connection and generic 100 nF value are withdrawn.

C26: the old VDD tie is also withdrawn. Its signal-side route is still unresolved. Opposite capacitor-pad ground assignments remain hypotheses.

Programming lines and the empty option network

The same programming pins may serve other firmware functions during normal operation.

The upper image is IMG_2437; the lower is IMG_2438. Both retain their original pixels and orientation.

Routes under the IC body or into vias may still require a few targeted continuity checks; a sharper photo cannot expose covered copper.

Pin 27 / RB6 / ICSP clock

The lower pad of D4 and lower pad of R32 join this pin. The earlier R32-to-PIR-supply tie is removed.

Pin 28 / RB7 / ICSP data

The lower pad of D5 and upper pad of R40 join this pin. The earlier R40-to-VDD tie is removed.

Pin 26 / RB5 to TP10 and R35 upper

Follow the long loop outside D4, across the board edge and below Q9. It joins TP10. R35 lower instead joins Q9 lower-left; the empty resistor separates these nodes.

C41 to TP4

The right capacitor pad joins TP4. The continuation disappears under U4, so the previous antenna-net assignment is withdrawn.

What a clearer photo would help resolve

Take a straight-down, full-resolution PIC-area shot with both pin rows and nearby parts in focus. Also capture the top-edge tracks toward R11-R16 and LED1 in overlapping close-ups. Keep the actual board edge in frame.
